Key Points

- New medical respirator with patented technology
- Kills bacteria
- Destroys viruses including COVID-19
- High breathability
- Filtrate over 98% PM2.5 particles
- Can be used for up to 7 days
- 3D design for comfort and tight fit

1 New Influenza Respirator

- The AOP-KF95 Respirator is a new generation of respirators designed specifically for the use against Influenza types viruses including the COVID-19
- It uses Solid Alkali with patented technology to disinfect, sterilize, deodorize effectively and continuously
- The Solid Alkali is certified as non-toxic by the world's leading examination organization SGS and is 100% harmless to humans, animals and plants
- The Solid Alkali is infused into the masks with the effect of slowly emitting a low level of Chlorine Dioxide to eliminate pathogenic micro-organisms such as bacteria, viruses and fungus resulting in the relief of common fever
- Chlorine Dioxide has been classified by the World Health Organization (WHO) as the most safe, green and effective sterilizer
- Due to the anti-bacteria/virus, it can be used effectively for up to 7 days
- The mask is constructed from 5 layers of non-woven fabric to provide an effective defence against PM2.5 particles while retaining high breathability
- The 3D design is highly comfortable to wear and with limited restrictions to talking

2 Field Tested

- The AOP-KF95 Respirator was used effectively during the outbreak of the COVID-19 virus in China
- Care takers from hospitals in China reported faster recovery of patients due to the unique nature of the slow emitting Dioxides which kills bacteria and destroys viruses beyond the mask
- Hundreds of thousands of masks were also donated to hospitals in China
- Great reviews from end users as compared to traditional N95 masks
- On going demands from hospitals due to it's unique virus killing properties

3 What is AOP-KF Solid Alkali?

- New Bio-clean Material; Micro-nano Green Material; Advanced Catalytic Oxidation Material
- SGS tests showed "AOP-KF solid alkali does not produce harmful substance"
- Killing bacteria and virus effectively, but harmless to humans, animals and plants
- Slow generation of oxidation to effectively kill bacteria and destroys viruses over an extended period of time

 Superior performance compared to other technologies without harmful effects

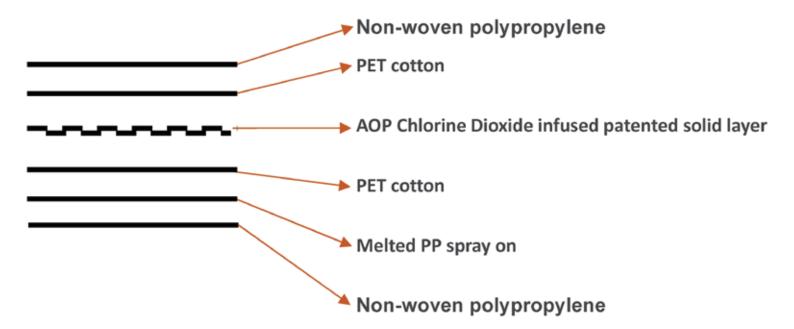

4 Respirator Construction

• The AOP-KF95 Respirator is made from 5 layers of non-woven fabric and 1 layer of infused Solid Alkali core layer to achieve high filtration and maximum protection:

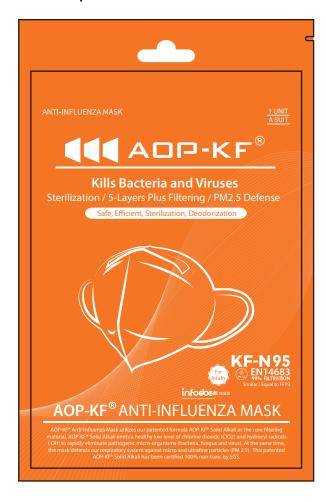

5 Packaging

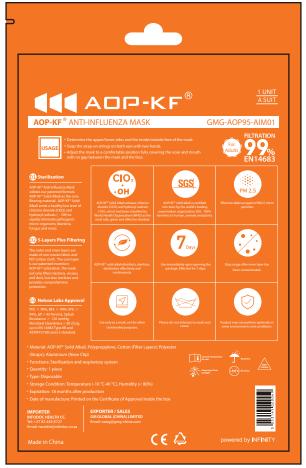

- Individual aluminum sleeves to retain the Solid Alkali for up to 2 years
- Each sleeve is a zipper lock aluminum bag which can be used to store the mask and allow it to sterilize itself
- 50 sleeves per color box

Test Procedure(s): Standard Test Protocol (STP) Number: STP0007 Rev 16

Deviation(s) None

Summary: The VFE test is performed to determine the filtration efficiency of test articles by comparing the viral control counts upstream of the test article to the counts downstream. A suspension of bacteriophage ФX174 was aerosolized using a nebulizer and delivered to the test article at a constant flow rate and fixed air pressure. The challenge delivery was maintained at 1.1 - 3.3 x 103 plaque forming units (PFU) with a mean particle size (MPS) of 3.0 µm ± 0.3 µm. The aerosol droplets were drawn through a six-stage, viable particle, Andersen sampler for collection. The VFE test procedure was adapted from ASTM F2101.

All test method acceptance criteria were met. Testing was performed in compliance with US FDA good manufacturing practice (GMP) regulations 21 CFR Parts 210 211 and 820.

Summary: This procedure was performed to evaluate surgical facemasks and other types of protective clothing materials designed to protect against fluid penetration. The purpose of this procedure is to simulate an arterial spray and evaluate the effectiveness of the test article in protecting the user from possible exposure to blood and other body fluids. The distance from the target area surface to the tip of the cannula is 30.5 cm. A test volume of 2 mL of synthetic blood was employed using the targeting plate method.

This test method was designed to comply with ASTM \$2862 and ISO 22609 (as referenced in EN 14683:2019 and AS4381:2015) with the following exception: ISO 22609 requires testing to be performed in an environment with a temperature of 21 35°C and a relative humidity of 85 ± 10%. Instead, testing was performed at ambient conditions within one minute of removal from the environmental chamber held at those parameters

All test method acceptance criteria were met Testing was performed in compliance with US FDA good manufacturing practice (GMP) regulations 21 CFR Parts 210, 211 and 820.

Deviation(s): None

Summary: This procedure was performed to evaluate the flammability of plain surface clothing textiles by measuring the ease of ignition and the speed of flame spread. The parameter of time is used to separate materials into different classes, thereby assisting in a judgment of fabric suitability for clothing and protective clothing material. The test procedure was performed in accordance with the test method outlined in 16 CFR Part 1610 (a) Step 1 - testing in the original state. Step 2 - Refurbishing and testing after refurbishing, was not performed. All test method acceptance criteria were met. Testing was performed in compliance with US FDA good manufacturing practice (GMP) regulations 21 CFR Parts 210, 211 and 820.

The 16 CFR Part 1610 standard specifies that 10 replicates are to be tested if, during preliminary testing, only 1 test article exhibits flame spread and it is less than 3.5 seconds or the test articles exhibit an average flame spread less than 3.5 seconds. Five replicates are to be tested if no flame spread is observed upon preliminary testing, if only 1 test article exhibits flame spread and it is equal to or greater than 3.5 seconds or if the average flame spread is equal to or greater than 3.5 seconds. Test Procedure(s): Standard Test Protocol (STP) Number: STP0005 Rev 07

QE22125

Deviation(s): Quality Event (QE) Number(s):

Summary: This procedure was performed to evaluate the non-viable particle filtration efficiency (PFE) of the test article. Monodispersed polystyrene latex spheres (PSL) were nebulized (atomized), dried, and passed through the test article. The particles that passed through the test article were enumerated using a laser particle counter.

A one-minute count was performed, with the test article in the system. A one-minute control count was performed, without a test article in the system, before and after each test article and the counts were averaged. Control counts were performed to determine the average number of particles delivered to the test article. The filtration efficiency was calculated using the number of particles penetrating the test article compared to the average of the control values.

The procedure employed the basic particle filtration method described in ASTM F2299, with some exceptions; notably the procedure incorporated a non-neutralized challenge. In real use, particles carry a charge, thus this challenge represents a more natural state. The non-neutralized aerosol is also specified in the FDA guidance document on surgical face masks. All test method acceptance criteria were met. Testing was performed in compliance with US FDA good manufacturing practice (GMP) regulations 21 CFR Parts 210, 211 and 820.

Deviation Details: Controls and sample counts were conducted for one minute instead of an average of three one minute counts. This change shortens the total test time for each sample but will still provide an accurate determination of the particle counts. An equilibrate is a dwell period where the challenge is being applied to the test article for a certain period of time before test article counts are counted. The equilibrate period was reduced from 2 minutes to a minimum of 30 seconds which is sufficient time to clear the system of any residual particles, and establish a state of stable equilibrium before sample counts are taken. Test method acceptance criteria were met, results are valid.

Test Article: AOP-KF Study Number: 1279700-S01 Study Received Date: 21 Mar 2020

> Testing Facility: Nelson Laboratories, LLC 6280 S. Redwood Rd.

Test Procedure(s): Standard Test Protocol (STP) Number: STP0036 Rev 15

Customer Specification Sheet (CSS) Number: 202001695 Rev 01

Deviation(s):

Summary: The testing was conducted in accordance with EN 14683:2019, with the exception of approximate volumes of eluent used when performing the extraction procedure and a temperature range of 30-35°C used for aerobic incubation.

When bioburden results are calculated using a software program, manual calculations may differ slightly due to rounding. The counts determined on products are colony forming units and may not always reflect individual microorganisms. The sponsor performs any statistical analysis and determines the acceptable limits. Testing was performed in compliance with US FDA good manufacturing practice (GMP) regulations 21 CFR Parts 210, 211 and 820.

Results:

4	6.8	<3	<3	5.9	0.9
5	6.4	3 ^a	<3	6.1	1.0
Recovery Efficiency			24.8% ^b		

< = No Organisms Detected

Note: The results are reported as colony forming units per test article.

^b The recovery efficiency may be impacted due to spreaders on the membrane.

- 2. 试验条件
 - 1) 环境温度: 23.5℃
 - 2) 环境湿度: 57%RH
- 3. 测试步骤
 - 1) 先不放样品,利用采样器和喷雾器调整细菌气溶胶浓度为(2200±500) CFU,作为阳性质控值。
 - 2) 将试验样品夹在采样器上端,被测试面向上并采样。
 - 3) 待样品测试完成后,再测试一次阳性质控。然后收集 2 min 气溶胶室中的空气样品,作为阴性质控, 在此过程中不能向喷雾器中输送细菌悬液。
- 4. 计算公式

细菌过滤效率BFE= $\frac{c-T}{c}$ ×100%(c 为阳性质控平均值,T 为试验样品计数之和)

检测结果:

样品编号	试验菌种	细菌过滤效率(BFE) (%)

8. 試験条件

- ①自然減衰 (コントロール); 試験ウイルス液のみを振とうした際の試験ウイルス数の 経時変動
- ②対照ボール;試験品の代わりに対象ボール(ガラスビーズ)を入れ、振とうした際の 試験ウイルス数の経時変動
- ③AOP-KF ボール; 試験品を入れ、振とうした際の試験ウイルス数の経時変動

9. 試験微生物

ウイルス: Escherichia coli phage φX174 NBRC 103405 (大腸菌ファージ)

宿 主 菌: Escherichia coli NBRC 13898 (大腸菌)

10. 試薬および機器・器材

- 1) 主な試薬
 - · Nutrient Broth (Difco)
 - ・普通ブイヨン (栄研)
 - ・塩化ナトリウム(和光、特級)
 - · Agar (Difco)
 - 普通寒天培地 (日水)
 - リン酸緩衝生理食塩液(エルメックス)

2) 主な機器・器材

- インキュベータ (MIR-153、MIR-553、三洋)
- ・ネオシェーカー (NS-LR、アズワン)
- ・ガラスビーズ (BZ-2、アズワン、直径約 2 mm)

11. 方法

1) 試験操作

試験品をアルミホイルで包み、121°C、15 分間で高圧蒸気滅菌後、乾燥させた。試験ウイルスを 1/50 濃度の普通ブイヨン培地に懸濁し、約 2×10^4 PFU/mL の試験ウイルス液とし、110 mL 容量滅菌コップ($\phi50\times H60$ mm)に 10 mL の試験ウイルス液を入れ、蓋をした。コップを水平振とう数 150 ± 10 rpm、振幅 30 ± 5 mm の条件で、 35 ± 1 °C、 24 ± 1 時間振とうした。1、6、24 時間後、各コップ内の試験液を遠沈管に取り、3,000 rpmで 1 分間遠心し、上清の 8 mL を採り、試料原液とした。また、試験品なし、および対照ボールを入れ、同様の操作をし、それぞれ自然減衰、対照とした。

2) 試験ウイルス液の調製

Nutrient Broth で、 36 ± 2 ℃にて一晩培養した宿主菌液に、試験ウイルスを接種し、半流動寒天(Nutrient Broth+0.5%塩化ナトリウム+0.5%Agar)と混合して普通寒天培地に重層した。 36 ± 2 ℃で 18 時間培養後、宿主菌を遠心除去し、孔径 $0.22~\mu m$ のメンブランフィルタでろ過して約 10^{10} PFU/mLの試験ウイルス液を得た。これを 1/50 濃度の Nutrient Broth で 1,000,000 倍に希釈し、試験に供した。

3) 試験ウイルス数の測定

試料原液について、リン酸緩衝生理食塩液で 10 倍段階希釈列を作製した。その試料原液、または希釈液と宿主菌を半流動寒天に混合して普通寒天培地に重層し、 36 ± 2 $^{\circ}$ $^{\circ}$

4) 減少率の算出

コントロールの試験ウイルス数および各試験液の試験ウイルス数から、減少率を算出した。算出方法については、表3の脚注に示した。

12. 結果

表 1 および、図 1 に経過時間ごとの試験ウイルス数を示した。

表 2 に経過時間ごとの試験ウイルス数の対数値を示した。

表 3 に経過時間ごとの対数減少値と減少率を示した。

試験品において、6時間作用後の試験ウイルス数は定量下限値未満(<5 PFU/mL)となり、減少率は>99.9%であった。
